[Movie Ticket Booking System]

Customer books 1 seat and pays by UPI

Made with AI

SOLID Principles

1. Single Responsibility Principle (SRP)

Example in the project:

- The Movie class only stores movie details (title, language, duration).
- The TicketPrinter class only prints the ticket.

Explanation: Each class should have only one responsibility. If the Booking class also handled ticket printing, it would violate SRP because booking and printing are two separate responsibilities.

2. Open/Closed Principle (OCP)

Example in the project:

- An abstract Payment class is defined.
- If a new payment method like NetBanking is needed, a new class NetBankingPayment can be created without modifying existing classes such as BookingService or Payment.

Explanation: The system should be open for extension but closed for modification. This ensures new features can be added without breaking or changing existing code.

3. Liskov Substitution Principle (LSP)

Example in the project:

- UpiPayment, CardPayment, and CashPayment all inherit from the Payment class.
- A pointer like Payment* p; p->pay(amount); can call any child class without requiring extra setup.

Explanation: Derived classes must be usable in place of their base class without altering the correctness of the program. This guarantees consistent behavior when substituting subclasses.

4. Dependency Inversion Principle (DIP) (Optional Bonus)

Example in the project:

- BookingService should not directly create a CardPayment or UpiPayment object. Instead, it should receive a Payment& (reference to the abstract class).

Explanation: High-level modules (like BookingService) should depend on abstractions (Payment) rather than low-level modules (specific payment types). This makes the system flexible and easier to extend.

Conclusion

Conclusion: The Cinema Ticket Booking System was successfully designed and implemented as a menu-driven C++ console application. The system allows customers to view movies and shows, check seat availability, book one or more seats, make payments through UPI, Card, or Cash, and receive a printed ticket with booking details. It also supports cancellation, ensuring seats become available again. The project demonstrates key object-oriented programming concepts such as encapsulation, inheritance, polymorphism, composition, and abstraction. By modularizing the code into separate classes, the design remains extensible and easy to maintain. The demo run confirms that all functional requirements (F1–F8) are met, and the system behaves correctly under edge cases like booking an already-booked seat or failed payment. Overall, the assignment achieves its objectives and provides a practical example of
